3	2420030773	M Mahalakshmi
Name of the Guide		Venkateswari Ketineni

Abstract:

Modern logistics and supply chain operations involve the movement of products from suppliers to warehouses and customers through activities such as inventory management, order processing, shipment handling, and delivery tracking. Traditional systems may face challenges such as limited coordination, delayed information, inventory inconsistencies, and difficulty in scaling individual operations. These challenges create a need for a flexible and scalable platform that can manage logistics activities efficiently.

To address this need, this project proposes LogiSphere – Cloud-Native Logistics and Supply Chain Management Platform, a digital platform designed to manage and track products, inventory, orders, shipments, and deliveries throughout the supply chain. The system enables suppliers to register products, warehouses to manage inventory, customers to place and track orders, and administrators to monitor logistics operations through a centralized dashboard.

The platform is developed using a microservices-based architecture with independent Spring Boot services such as Order Service, Inventory Service, Shipment Service, Delivery Service, and User/Auth Service. Spring Cloud Gateway is used for request routing, while Eureka provides service discovery.

REST APIs and Apache Kafka enable communication between services, allowing business functions to operate independently and efficiently. MySQL is used for data storage, and React.js provides the web-based user interface.

The cloud-native implementation uses Docker for containerization and Kubernetes for container orchestration, enabling the services to be deployed, managed, and scaled independently. Docker Compose supports local development, while Kubernetes provides deployment, service management, scaling, and recovery capabilities. Git and GitHub support version control and development collaboration, while Prometheus and Grafana can be used for monitoring system performance and service health.

Overall, LogiSphere aims to provide a scalable, reliable, and efficient logistics management solution by combining microservices, APIs, containerization, orchestration, and cloud-native technologies. The platform improves visibility and coordination across the supply chain while demonstrating the practical application of modern cloud-native application development principles.

Project Architecture/Project Overview:

Modern Tools and Technologies

- Java
- Spring Boot
- React.js
- REST APIs
- Spring Cloud Gateway
- Eureka
- Apache Kafka
- MySQL
- Redis
- Spring Security
- JWT
- Swagger/OpenAPI
- JUnit
- Mockito
- Postman
- Docker
- Kubernetes
- Git & GitHub

Conclusion

LogiSphere demonstrates how service-oriented architecture and microservices can be used to manage logistics operations through independent, loosely coupled, and reusable services. The use of REST APIs, service discovery, Kafka, and independent services improves scalability, flexibility, interoperability, and maintainability of the system.
